1 Introduction

In this project, we follow MAML [?], a milestone paper in meta-learning area, which proposed a fast adaptation. Thank all the reviewers for their kind advice and their time. We will make it clear on some points mentioned in the reviewer comments.

- For the writing and diagram, thanks for reminding. Our writing may be not good enough and some of the diagrams are coarse due to the limited time. We will refine them, including adding an abstract part and a discuss section.
- For the diagram, we would like to add some diagrams and data visualizations to make the paper easier to be read.
- For comparison with baselines, the reproduced results from the original paper are actually the baselines of our proposed method (Table 1 2).
- For the performance of proposed strategies on other tasks or other datasets, we can treat it as the future work, which is a exciting idea.
- For the SOFA method as a comparison, we plan to conduct a comparison on it, but we did not have extra time before the deadline of the submission. So, we did not finish it at that time.
- Thanks for pointing out the typos and we will fix it.
